

D-mannose for Recurrent Urinary Tract Infection Prophylaxis Clinical Trial

The Department of Urology is conducting an internally funded clinical trial on D-mannose for rUTI prophylaxis on post-menopausal women

PURPOSE	INCLUSION	INCLUDES
To elucidate the efficacy of D-mannose on preventing uncomplicated rUTI.	We are recruiting post-menopausal women between 55-85 years old, who have been diagnosed with recurrent UTI, and are interested in considering a preventive approach.	This study requires 7 visits over a 12-month period. Each visit will be compensated, for a total of \$500. The D-mannose or placebo capsules will be provided by the research team. At each visit, we will obtain a urine sample and two vaginal/perianal swabs.
